

Motion Planning: Rapidly-Exploring Random Trees

Divyam Rastogi

Book recommendation

Available for free - online!

<http://planning.cs.uiuc.edu/>

Chapter:
**Sampling-based
Motion Planning**

Motion planning

Rapidly-Exploring Random Trees

- ▶ Sampling based - no fixed grid needed
- ▶ Explores free space rapidly (Voronoi bias)
- ▶ Can handle differential constraints
- ▶ Probabilistic complete

Rapidly-Exploring Random Trees

- ▶ Sampling based - no fixed grid needed

Voronoi Bias

Rapidly-Exploring Random Trees

BUILD_RRT(q_{init})

```
1   $\mathcal{T}.\text{init}(q_{init});$ 
2  for  $k = 1$  to  $K$  do
3       $q_{rand} \leftarrow \text{RANDOM\_CONFIG}();$ 
4       $\text{EXTEND}(\mathcal{T}, q_{rand});$ 
5  Return  $\mathcal{T}$ 
```

EXTEND(\mathcal{T}, q)

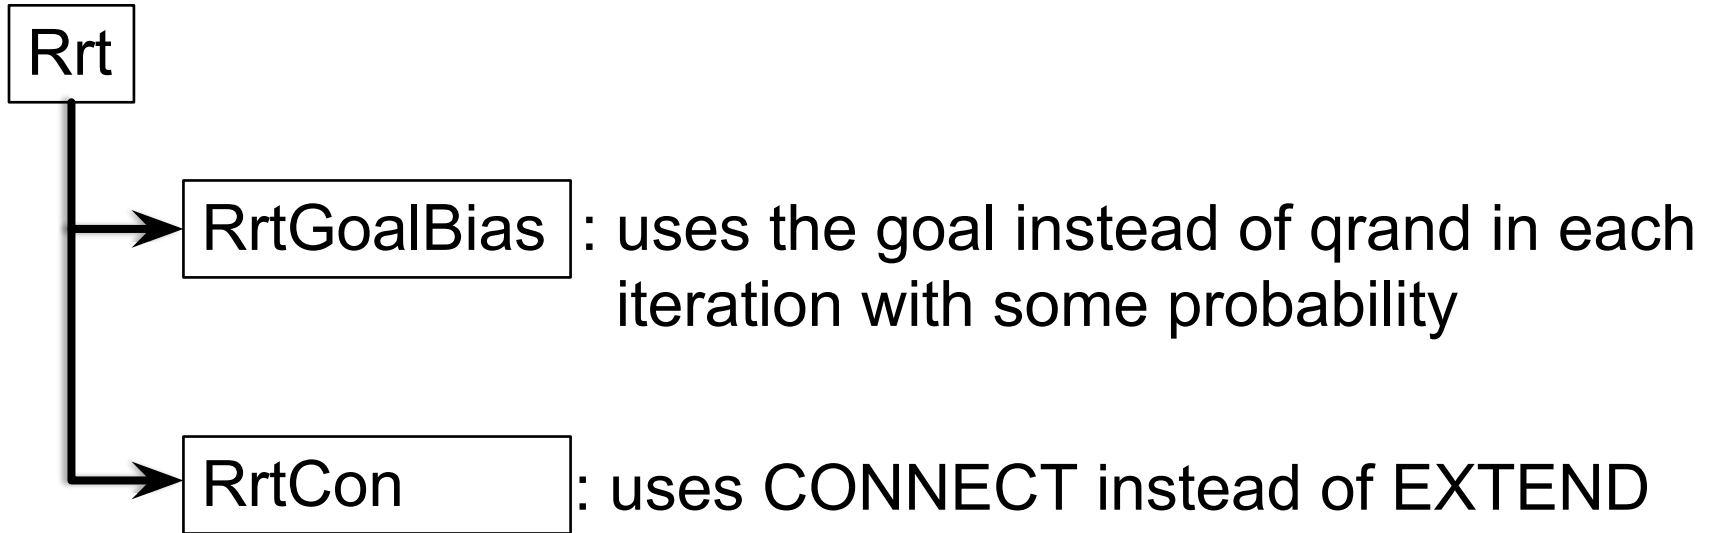

```
1   $q_{near} \leftarrow \text{NEAREST\_NEIGHBOR}(q, \mathcal{T});$ 
2  if  $\text{NEW\_CONFIG}(q, q_{near}, q_{new})$  then
3       $\mathcal{T}.\text{add\_vertex}(q_{new});$ 
4       $\mathcal{T}.\text{add\_edge}(q_{near}, q_{new});$ 
5      if  $q_{new} = q$  then
6          Return Reached;
7      else
8          Return Advanced;
9  Return Trapped;
```

Naive Random Tree

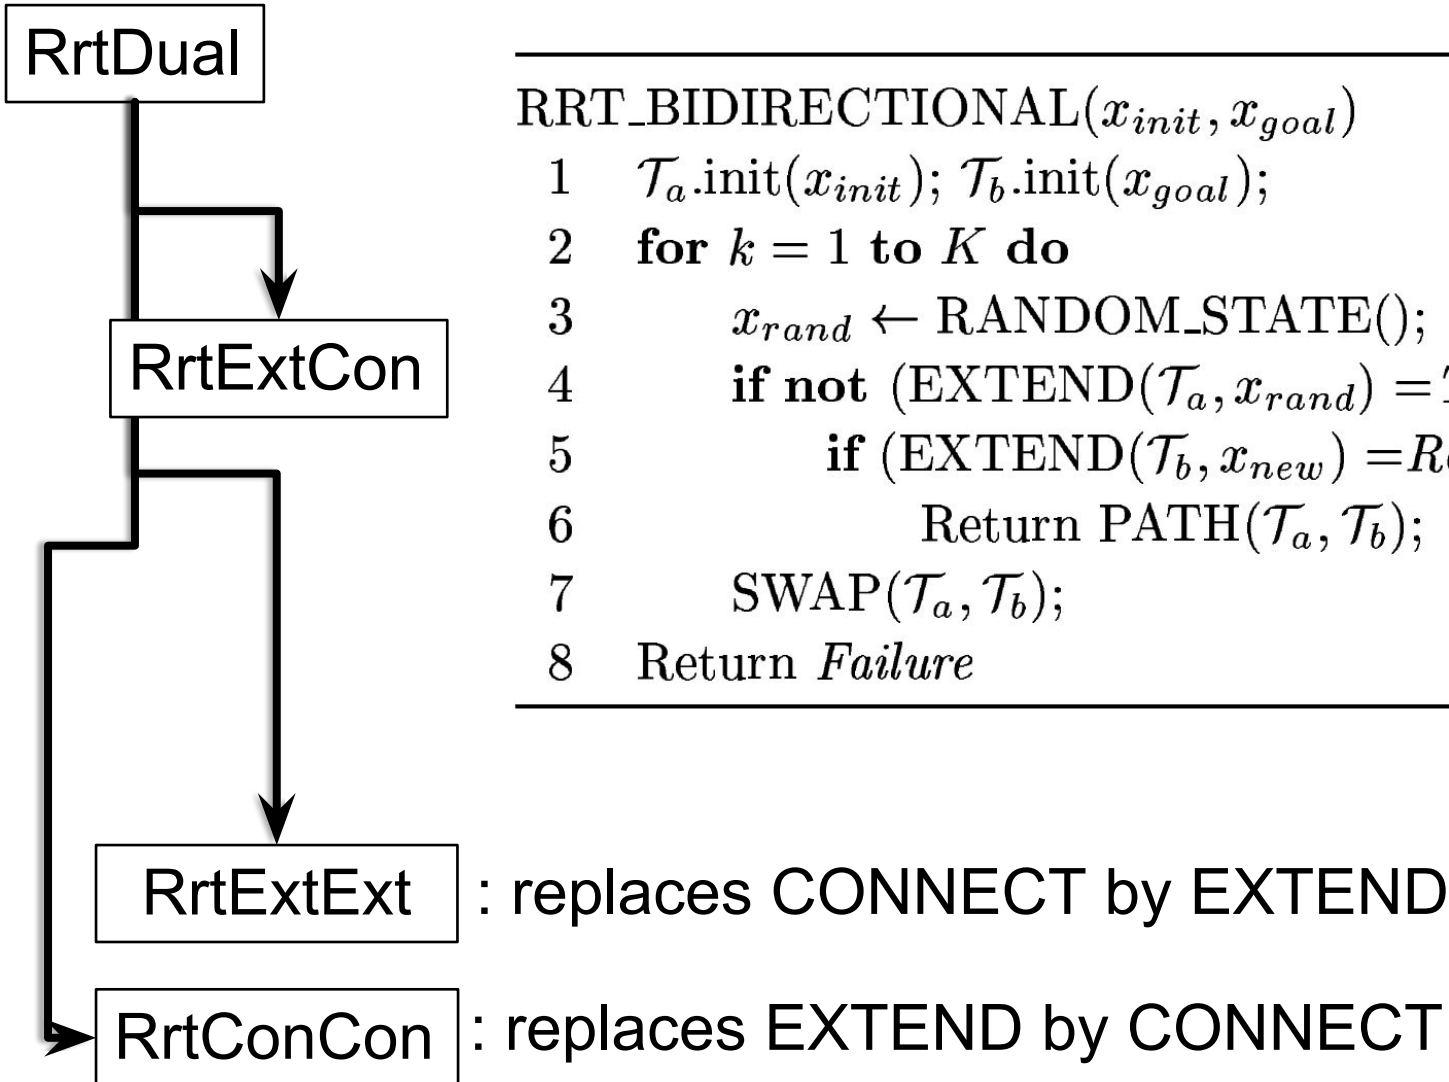

RrtGoalBias/RrtCon

CONNECT(\mathcal{T}, q)

```
1  repeat
2       $S \leftarrow \text{EXTEND}(\mathcal{T}, q);$ 
3  until not ( $S = \text{Advanced}$ )
4  Return  $S$ ;
```

Using two trees

```
RRT_BIDIRECTIONAL( $x_{init}, x_{goal}$ )
1   $\mathcal{T}_a.\text{init}(x_{init}); \mathcal{T}_b.\text{init}(x_{goal});$ 
2  for  $k = 1$  to  $K$  do
3       $x_{rand} \leftarrow \text{RANDOM\_STATE}();$ 
4      if not ( $\text{EXTEND}(\mathcal{T}_a, x_{rand}) = \text{Trapped}$ ) then
5          if ( $\text{EXTEND}(\mathcal{T}_b, x_{new}) = \text{Reached}$ ) then
6              Return  $\text{PATH}(\mathcal{T}_a, \mathcal{T}_b);$ 
7       $\text{SWAP}(\mathcal{T}_a, \mathcal{T}_b);$ 
8  Return Failure
```

Utility

Exploration versus Exploitation

Exploration seeks **understanding of the state space**, irrespective of a particular task. In motion planning, the process **exploration** seeks to understand the connectivity of the configuration space, irrespective of solving a particular motion planning problem.

Guided exploration seeks **efficient** understanding of the state space, irrespective a particular task, by **leveraging available information**.

Exploitation strives to **accomplish a particular task as efficiently as possible** by **leveraging available information**.

In motion planning, **exploitation** seeks a valid path for a **particular task**, based on available information.

Robotics Library: www.roboticslibrary.org

- ▶ A framework for developing robotics applications

math Mathematics	util Timers, Threads, Mutexes, ...	xml XML Abstraction
hal Hardware Abstraction	kin DH-Kinematics	mdl Rigid Body Kinematics/Dynamics
sg Scene Graph Abstraction	plan Motion Planning	ctrl Operational Space Control

- ▶ Pro: All models we need are already included
- ▶ Con: only sparse documentation
(there are doxygen docs)

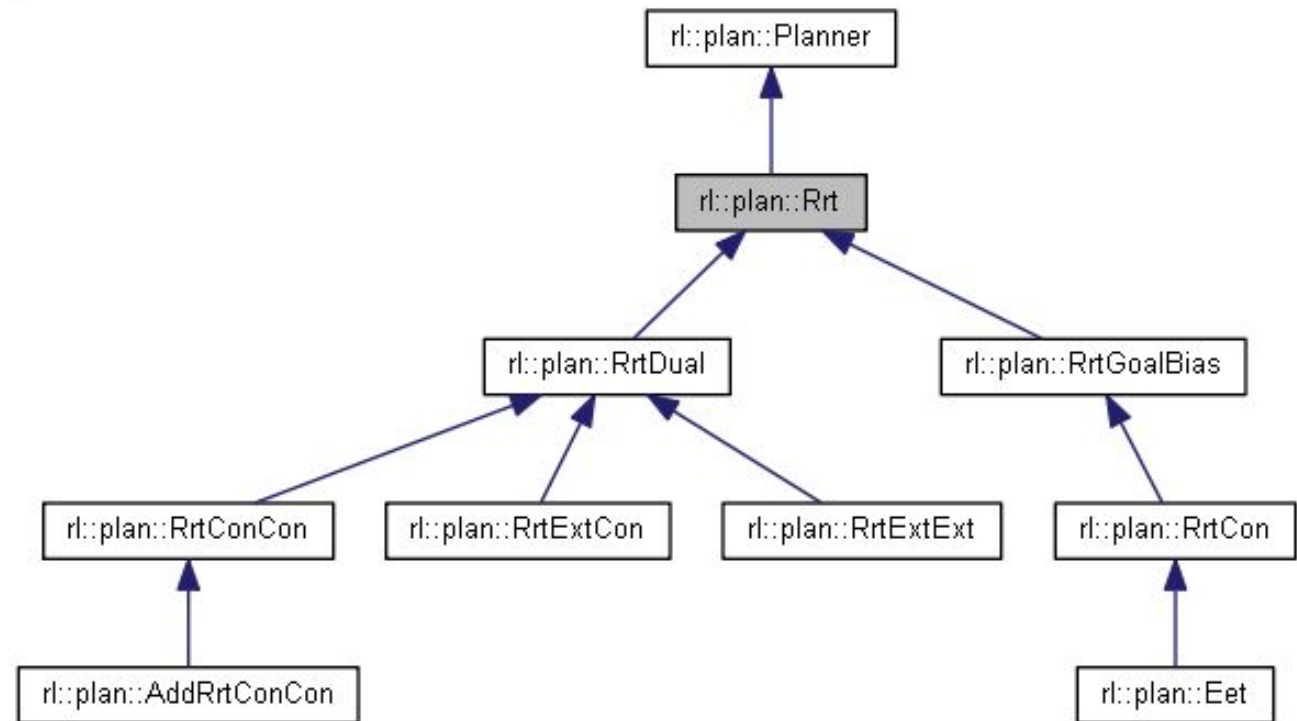

rl::plan::Rrt Class Reference

Inheritance diagram for rl::plan::Rrt:

You can easily install RobLib on Ubuntu

► Install prerequisites

- `sudo add-apt-repository ppa:roblib/ppa`
- `sudo apt-get update`
- `sudo apt-get install librl-dev`

- Download and extract tutorialPlan.zip:

- `tar xzf rl-0.7.0.zip`

► Build

- `cd tutorialPlan/build`
- `cmake ..`
- `make`

► Test:

- `cd tutorialPlan/build`
- `./tutorialPlan` - Press space to start planning, F12 to reset

Windows (VS2010) installation is also possible

► Install prerequisites

- Install Visual Studio 2010 (Express is fine)
- Install Cmake
- Install Qt <http://download.qt-project.org/archive/qt/4.8/4.8.5/qt-win-opensource-4.8.5-vs2010.exe>
- Install roblib <http://www.roboticslibrary.org/tutorials/install-windows> follow all instructions on the page!
- Download and extract tutorialPlan.zip:

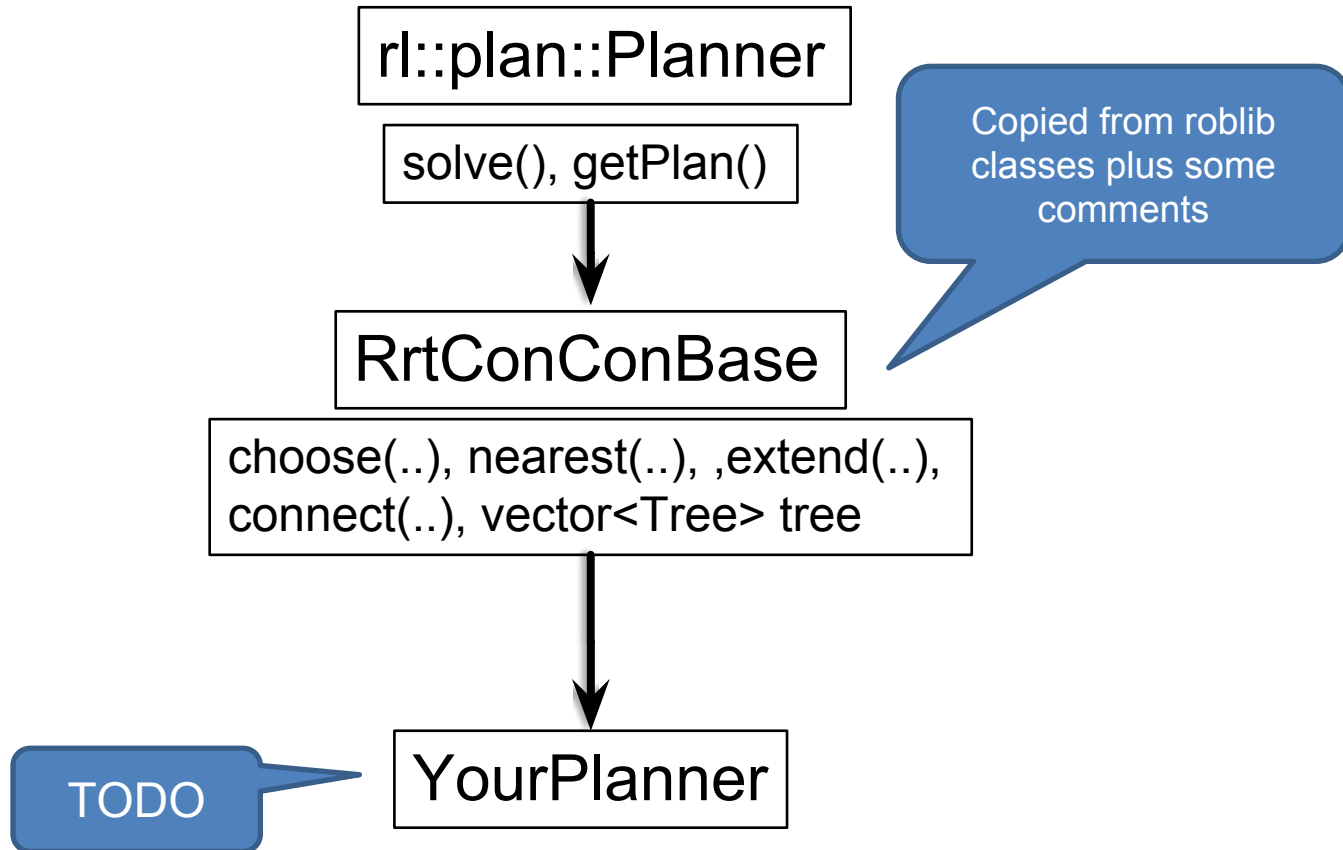

► Build:

- Open tutorialPlan/CMakeLists.txt in CMake - generate Visual Studio 10 project files in the build directory
- Open build/tutorialPlan.sln in Visual Studio 2010
- Compile RelWithDebInfo (Debug is not supported - sorry)

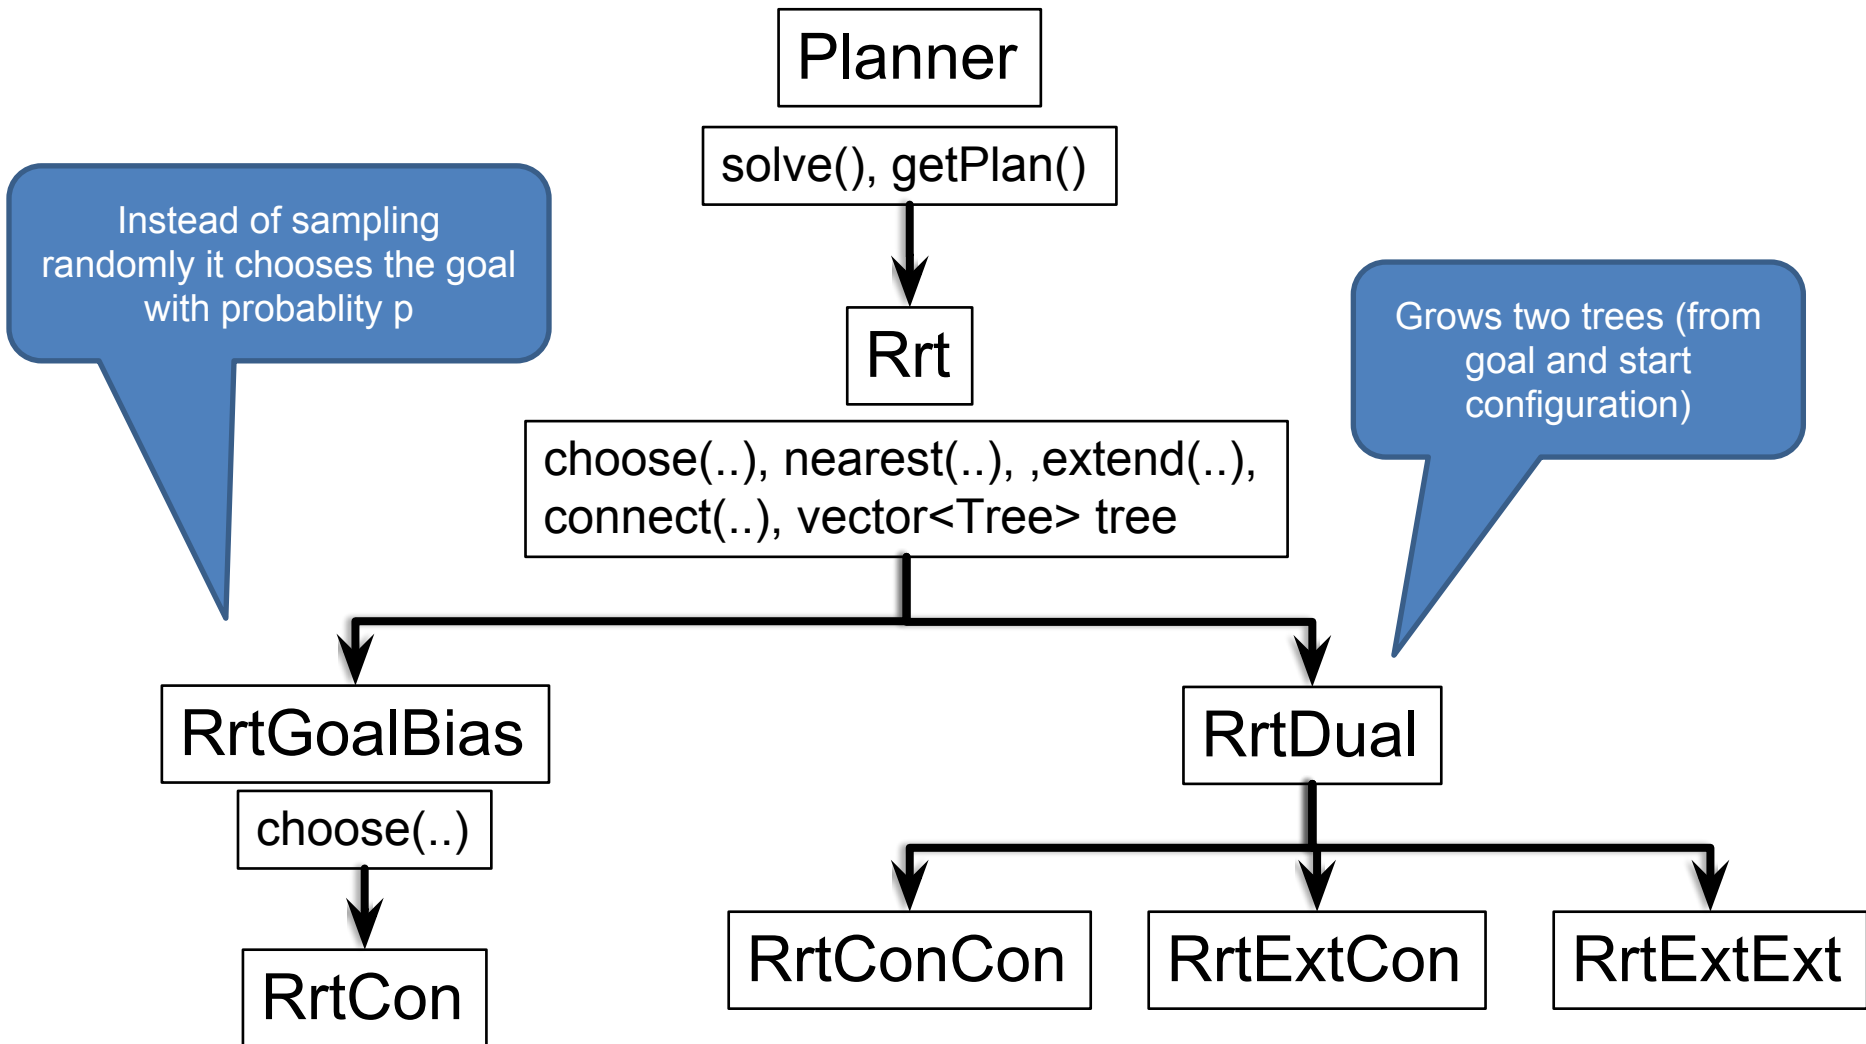

► Test:

- press F5 or open build/RelWithDebugInfo/tutorialPlan.exe - Press space to start planning, F12 to reset

Hierarchy of RRT Classes for assignment

Hierarchy of RRT Classes in rl::plan

Writing Your Planner

- ▶ Modify YourPlanner.cpp
- ▶ Inherit from RrtConConBase (or any other RRT based planner in rl::plan)
- ▶ Set parameters of your algorithm in TutorialPlanSystem.cpp
- ▶ Implement better choose(), connect(), extend(), solve()
- ▶ You can add parameters for vertices in RrtConConBase::VertexBundle

Evaluating your algorithm

- ▶ Every time you run `./tutorialPlan` an entry is added to `benchmark.cvs`
- ▶ This entry shows: computation time needed to solve the problem, number of nodes and edges created, number of queries needed to construct them, etc.
- ▶ Take a look into
`~/roblib/examples/tutorialPlan/tutorialPlanSystem.cpp` to see the details and/or to edit them
- ▶ Run your algorithm at least ten times! – Change start and goal!
